WEB DEVELOPMENT

ACTIVITY-BASED LEARNING PROJECT REPORT

Student Name	Naga Meghana
Roll Number	3
Branch	CSE
Section	21
College	NRI

Submitted as part of the Web Development activity-based learning work.

HTML • CSS • Responsive Layout • Web Design

1. Introduction

This project report presents three web development case studies created using HTML and CSS. Each website demonstrates a different layout, visual style, and set of content sections. The report is organised so that screenshots and the final GitHub repository link can be added before submission.

2. Objectives

• Create structured web pages using HTML.
• Style pages using separate CSS files.
• Practise navigation links, sections, cards, tables/forms where appropriate, and responsive layouts.
• Organise the project files and publish them in a GitHub repository.

3. Technologies Used

HTML5: Used to structure page content, headings, navigation, sections, links, and forms.
CSS3: Used to style colours, typography, spacing, layouts, cards, hover effects, and responsive behaviour.
GitHub: Used to store and share the project files online.

4. Project Structure

The project contains six code files: one HTML file and one CSS file for each of the three websites.

Website	HTML file	CSS file
Personal Portfolio	case1.html	case1.css (confirm filename)
Food Ordering Website	food.html	food.css
College Fest Website	fest.html	fest.css

Note: Confirm the exact portfolio filenames used in your folder and update this table if needed.

5. Case Study 1: Personal Portfolio Website

Aim: To create a personal website that introduces the student and presents education, achievements, hobbies, skills, projects, and contact information.

Website Sections

Main sections: Home, About Me, Education, Achievements, Hobbies, My Skills, My Projects, and Let's Connect.

HTML Implementation

HTML implementation: Semantic headings, navigation links, content sections, project descriptions, and contact details provide the page structure.

CSS Implementation

CSS implementation: A light lavender background, readable typography, consistent spacing, section cards, skill indicators, and clear navigation can be used to create a calm and professional appearance.

Output Screenshot

Insert a clear screenshot of the running website here before final submission.

6. Case Study 2: Food Ordering Website

Aim: To design an attractive food website that displays food categories, featured dishes, prices, special offers, and contact information.

Website Sections

Main sections: Navigation bar, hero section, food categories, menu cards, special offer, reviews, and contact/footer area.

HTML Implementation

HTML implementation: Links, headings, images, food cards, prices, and section containers organise the menu content.

CSS Implementation

CSS implementation: A warm cream background with soft orange accents, rounded cards, balanced spacing, image styling, hover effects, and responsive grids improves readability.

Output Screenshot

Insert a clear screenshot of the running website here before final submission.

7. Case Study 3: College Fest Management Website

Aim: To create a college festival website that presents events, a sample schedule, and a registration form.

Website Sections

Main sections: Home, introduction, events, schedule, registration form, and footer.

HTML Implementation

HTML implementation: Navigation links, event cards, schedule details, labels, input fields, selection lists, and a submit button structure the page.

CSS Implementation

CSS implementation: A soft blue and white palette, consistent typography, event cards, clear form fields, and responsive layout create an organised interface.

Output Screenshot

Insert a clear screenshot of the running website here before final submission.

8. Testing and Verification

Before submission, open each HTML file in a browser and check the following:

• The correct CSS file is linked and styles are visible.
• Navigation links move to the correct sections.
• Text and images display clearly.
• The layout remains usable on a smaller screen.
• Forms and buttons are understood as demonstrations unless connected to a backend.

9. GitHub Repository

Repository URL: _____

Paste the public GitHub repository link here after confirming that all six project files are uploaded.

10. Conclusion

This activity-based project provides practice in building web pages with HTML and styling them with separate CSS files. The three case studies demonstrate personal profile presentation, food menu design, and college event information. Testing the pages and documenting their outputs helps prepare the work for review and submission.
